

My Compiler Project

By Bob (ID: 1002)

Introduction

The first step in compilation is reading the source code. It is very important to understand how strings are processed.

Lexical analysis is the first phase of a compiler. It takes the modified source code from language preprocessors that are written in the form of sentences. The lexical analyzer breaks these syntaxes into a series of tokens, by removing any whitespace or comments in the source code.

This phase is typically implemented using a finite automaton.

The lexical analyzer works closely with the syntax analyzer. It reads character streams from the source code, checks for legal tokens, and passes the data to the syntax analyzer when it demands.

Conclusion

In summary, the lexer is the foundation of the compilation process.
